

Actistem Therapy is a breakthrough technology that allows veterinarians to utilize the patient's own stem cells to treat their condition. Stem Cells are harvested from fat, processed on site and administered to the patient all in one day. Leftover cells can be sent off for cryostorage for convenient treatments in the future.

**Same Day Procedure**

**All Natural Approach**

**Targets the cause not just the symptoms**

### How can it help your pet?

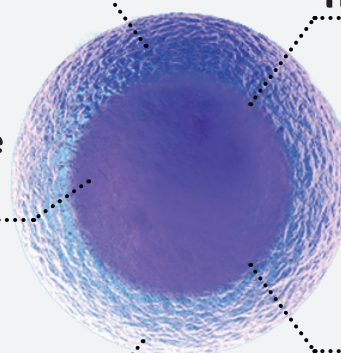

**Osteoarthritis**

**Hip Dysplasia**

**Soft Tissue Injuries**

**Other Inflammatory Diseases**

**Degenerative Joint Disease**

### FAQs

#### What happens to my pet when they come in for Actistem therapy?

First, your vet will put your pet under general anesthetic. Then, he/she will make a small incision and collect 2-4 tablespoons of fat (either in the belly or behind the shoulder blades). Then a trained technician will process the sample, right in the clinic. The sample is activated then introduced to the patient. The patient can then go home, same day.

#### Is my pet a candidate?

Schedule a consultation with your veterinarian to find out if your pet is a candidate. The most common applications for Actistem Therapy are: Arthritis, Hip Dysplasia, Joint Disease, Ligament Injuries, and more!
